Ornamental Grasses and Grasslike Plants A. J. Oakes 2012-12-06 The Ornamental, or grass family, is second in size only to the Compositae, or sunflower family. It is among the most important plant families in the world. The major food crops of the world are found in the grass family. From time immemorial, grasses have provided food and shelter for humanity, domesticated livestock, and wildlife; without grasses, these forms of life might cease to exist. The grass family is large in size, diverse, and ubiquitous in distribution. Earth would be bleak and bare, indeed, in the absence of this life-sustaining plant family. In addition to its economic and industrial value, the grass family has some ornamental value. It provides us with physical sustenance and gives us much pleasure and satisfaction in its ornamental forms. The purpose of this book is to point out the value and usefulness of grasses as ornamentals and to define the attributes and uses in the home, in the garden, and in the landscape. Ornamental grasses serve a unique and significant purpose in ornamental horticulture. Horticulturists, other plant scientists, and nursery personnel are more fully aware of the value and usefulness of grasses as ornamentals than is the general public. It is mainly for this reason that this work is directed toward the home gardener and the scientist alike, in the hope of enhancing reader appreciation of the role grasses play in ornamental horti culture.
